

I-CARE-SMART

Social Services Prague9 together with Principal engineering introduce : **AJPACH - Assistive unit for people with cognitive impairment**

Proportion of people with Alzheimer´s disease and other cognitive impairments in senior population is continuously increasing. People with cognitive deficiencies and their families and caregivers have to face serious challenges in two areas especially : SAFETY and FUTURE DEVELOPMENT of the patient´s condition.

AJPACH Assistive unit was developed to provide assistance in both the areas and thus to cover all the most pressing problems. The unit consists of a smart watch and a software application designed to

- Provide assistance in case of emergency thanks to the SOS button.
- Locate the client thanks to the GPS locator.
- Delay the onset of the more serious phases of the cognitive deficiency thanks to the cognitive games and exercises.
- Predict the future development of the illness based on the data collected.
- Reduce the burden of the caregivers.

If you are interested in how smart solutions are able to help seniors with cognitive impairments join AJPACH introduction session on 12 July 2021.
